User Stories

ID	User Story	Description	Priority	Estimated Time
1	Board Size	As a developer, I want to make two board sizes so that I can add different styles of play	Low	2 Hours
2	Board Type	As a player, I want to choose the board type (e.g., English, Hexagon, or Diamong) before starting a game so that I can play the variation of solitaire that best suits my skill level and preferences.	Low	1 Hour
3	Start new game of board size and type	As a developer, I want to start a new game with a chosen size and type so that the player can easily start a fresh game.	High	2 Hours
4	Make a move in game	As a player, I want to move a peg by jumping it over an adjacent peg into an empty hole so that I	High	4 Hours

		can remove pegs from the board and progress toward winning the game.		
5	Game is over	As a developer, I want the game to detect when no valid moves remain so that I know the game has ended..	Low	1 Hour

User Story ID & Name	**AC ID**	**Description of Acceptance Criterion**	**Status**
1. Board Size	1.1	Given the game is opened, when a number is inputted, then the size of the board will change	In-Progress
	1.2	Given the game is opened, when an invalid number or character is given, then revert back to the previous valid number	To-Do
2. Board Type	2.1	Given the player is on the game setup screen, when the player selects a board type, then the system highlights the selected type and shows a preview of the corresponding board layout.	To-Do

	2.2	Given the player has selected a board type, when the player starts a new game, then the system creates a board that matches the chosen layout, with the correct number of holes and pegs and the correct empty starting position.	
	2.3	Given the player has not explicitly chosen a board type, when the player starts a new game, then the system uses a default board type (e.g., English) and tells the player which type is in use.	
	2.4	Given a game is currently in progress, when the player attempts to change the board type, then the system asks the player to confirm that the current game will be abandoned before applying the change.	
3. Start new game of board size and type	3.1	Given the board type and size are selected, when a new game is started, then initialize the board state, size and type.	To-Do
	3.2	Given a game has been started, when new game is clicked once more, then wipe the current board state and start from a fresh game	To-Do

	3.3	Given the board type and size are selected, when autoplay is clicked, then let the computer play with a randomized set of moves.	To-Do
4. Make a move in game	4.1	Given the player has selected a peg, when the player chooses a highlighted empty hole two positions away in a straight line, with a peg in the hole between, then the system moves the selected peg to the destination, removes the jumped peg, and updates the board and peg count.	To-Do
	4.2	Given the player has selected a peg, when the player chooses an invalid destination (e.g., an occupied hole, a diagonal jump on a board that does not allow it, a jump over an empty hole, or a location off the board), then the system rejects the move, leaves the board unchanged, and displays a message explaining why the move is not allowed.	To-Do
	4.3	Given the player has selected a peg, when the player clicks the same peg again or selects an empty area, then the system deselects the peg	

		and clears all highlighted destinations.	
	4.4	Given the player has just completed a valid move, when the board is updated, then the system checks whether any legal moves remain and, if none do, ends the game and shows the final result.	
5. Game is over	5.1	Given a game is started, when one marble remains or no valid moves are available, then switch the game state to being over.	To-Do
	5.2	Given the game is finished, when any further action on the board is taken, then reject the action until a new game is started	To-Do
	5.3	Given the game is finished, when the game recognizes that the game has concluded, then count the number of marbles and give a rating	To-Do

Using Claude Sonnet 5.5

I am working on a game of solitaire. The goal is to specify the requirements with user stories and acceptance criteria of the target software that will allow a human player to play a Solitaire game The minimum features include choosing the board size and type, starting a new game, making a move, and determining if a game is over. I need you to generate two user stories, one for the board type and another for and one for making a move in the game. This should follow the format "As a player, i want [goal] so that [benefit]". For these two User Stories, you should also accompany them with an acceptance criteria, which should follow the format of "Given x, when y, then z".

User Story 1: Choosing the Board Type

User Story: As a player, I want to choose the board type (e.g., English, European, or Triangular) before starting a game so that I can play the variation of solitaire that best suits my skill level and preferences.

Acceptance Criteria:

1. **Given** the player is on the game setup screen, **when** the player views the board type options, **then** the system displays all supported board types (English, European, Triangular) with a name for each.
2. **Given** the player is on the game setup screen, **when** the player selects a board type, **then** the system highlights the selected type and shows a preview of the corresponding board layout.
3. **Given** the player has selected a board type, **when** the player starts a new game, **then** the system creates a board that matches the chosen layout, with the correct number of holes and pegs and the correct empty starting position.
4. **Given** the player has not explicitly chosen a board type, **when** the player starts a new game, **then** the system uses a default board type (e.g., English) and tells the player which type is in use.
5. **Given** a game is currently in progress, **when** the player attempts to change the board type, **then** the system asks the player to confirm that the current game will be abandoned before applying the change.

User Story 2: Making a Move

User Story: As a player, I want to move a peg by jumping it over an adjacent peg into an empty hole so that I can remove pegs from the board and progress toward winning the game.

Acceptance Criteria:

1. **Given** a game is in progress and it is the player's turn, **when** the player selects a peg that has at least one legal jump available, **then** the system highlights the selected peg and marks every valid destination hole.
2. **Given** the player has selected a peg, **when** the player chooses a highlighted empty hole two positions away in a straight line, with a peg in the hole between, **then** the system moves the selected peg to the destination, removes the jumped peg, and updates the board and peg count.
3. **Given** the player has selected a peg, **when** the player chooses an invalid destination (e.g., an occupied hole, a diagonal jump on a board that does not allow it, a jump over an empty hole, or a location off the board), **then** the system rejects the move, leaves the board unchanged, and displays a message explaining why the move is not allowed.
4. **Given** the player has selected a peg, **when** the player clicks the same peg again or selects an empty area, **then** the system deselects the peg and clears all highlighted destinations.
5. **Given** the player has just completed a valid move, **when** the board is updated, **then** the system checks whether any legal moves remain and, if none do, ends the game and shows the final result.

Fixes:

- Because I did not specify which type of board I was referring to, I had to adjust the examples given
- Some of the acceptance criterias were too generic or are a given, so those ones were excluded from the lists.
